Abstract

This paper aims to highlight the positive aspects of the application of modern methods of teaching and learning in studying ecotourism and sustainable development in local and regional horizon. We will present the importance of using modern teaching methods in teaching and studying ecotourism and sustainable development in local horizon, choosing for this Maramures region. In our research, we stopped on the Biosferei Reservation area – “Poiana cu Narcise” from Bistra village. An important aspect regarding the location of Bistra is that it lies at a distance of approximately 42 km from the so-called geographical center of Europe (Dilove town, Rahiv district, Zakarpatya region - Ukraine), it is an opportunity for Bistra village, capitalizing this, and the town can become a major European tourist attraction pole. For ecotourism, different plant species are natural attractions, interesting in that their ecosystems are untouched. The research was conducted with the help of a small group of undergraduates from the Geography of Tourism (Faculty of Geography – Babes-Bolyai University) from Bistrita extension during their teaching practice in an optional activity at the eleventh grade students from Bistrita Sports High School, in the second semester, year 2014.

Keywords: Reservation; biosphere; eco-tourism; teaching practice; attraction.

1. Introduction

Bistra commune is situated in the northern part of Maramures County at the Romanian-Ukrainian border. This territory extends on both units relief, Maramures Mountains and Maramures Depression. Mostly, Bistra village include the lower course of the river Viseu and its tributaries, and the village Valea Vişeuului is found at the confluence of Viseu with Tisa (Marin et al., 2002).

This is an Open Access article distributed under the terms of the Creative Commons Attribution-Noncommercial 4.0 Unported License, permitting all non-commercial use, distribution, and reproduction in any medium, provided the original work is properly cited.

From the administrative point of view, Bistra commune consists of three villages: Bistra located at the confluence of Bistra river with the Viseu River, Crasna Vișeului located along the valley Frumușăua and village Valea Vișeului located at the confluence of Viseu with Tisa.

Ecotourism is heavily dependent of the quality of the environment.

In developing of the ecotourism products should be considered, in general, the eco-tourists have a high educational potential. Therefore, and their expectations are much higher and achieve a product that meets those expectations is essential.

Education facilitates awareness that behavior changes toward accountability, participation, involvement in specific ecotourism activities are possible and that there are other ways to organize specific activities in the field. The education and awareness on the importance of nature conservation, as well as understanding and respecting the principles of ecotourism must start from local communities and visitors, but they must continue between local and central government.

2. Material and method

The position of Bistra commune in the area of Maramures Mountains and two major rivers of Maramuresului Land, determines the relief structure and the variety and type of vegetation, fauna and lack of pollution sources. Therefore this village benefit of picturesque places, with a favorable climate to recreation and leisure.

The relief units from Bistra village landscape have a particularly attractive aspect, affordable, long ridges that offer the possibility of developing ecotourism and rural tourism. From an altimetry report, the altitude levels are between 330 m at the confluence of Tisa with Vișeu and 1937 m, at Pop Ivan Peak. From geological point of view, are predominantly crystalline schist's and igneous rocks, sandstone, marl and conglomerates.

Vegetation on the territory of Bistra is rich and very diverse, represented on altitude floors depending of several key factors, such as climate, soil, slopes, lithological substrate. For ecotourism, different plant species are natural attractions, interesting in that their ecosystems is untouched. Bistra hydrography is represented by two major rivers of Maramures Country, Viseu River and Tisa River each with its tributaries (see Viseu River in figure 1).

Fig. 1. Viseului Valley

In the top of tourism activities in Maramures Mountains Natural Park and Poiana cu Narcise Biosphere Reservation on Bistra area is the pedestrian hiking and horse trekking. Many hikers are venturing on the Pop Ivan, Șerban, Poloninca and Muncelul massive for their natural beauty, and for natural lookout points that provide these mountain massifs. Poiana cu Narcise Reserve involves not only hiking to daffodils but also observing and analyzing these flowers blossom and observing other wildlife and birds (Marin et al., 2002).

In both protected areas, photo-safari is practiced, any tourist or resident willing recreation and adventure, armed with a camera but without motors, captures scenic landscapes, mountain flora, wildlife caught unawares, so practicing two ecotourism activities (Nistoreanu, 2006).

In the village Bistra the protected areas are valued by the practice of cycle tourism and mountain biking, e.g. on the Tocarnea, Luhei, Paltinu Tomnatecu peaks, bike tourists were surprised. The activities mentioned are not the only activities that can be practiced in protected areas of Bistra village.

Natural tourism potential occupies a major proportion compared with anthropic potential, for making a ministration for all four seasons is necessary to perform in various points of exploiting the natural tourism resources; hiking trails, lookout points, observation points of the fauna and flora, accommodation cabins, camping areas, slopes for skiing, recreation zones on the river valleys.

General and specific competencies, which are formed in high school through the centered educational process, based on geography, promote the following values and attitudes:

- o Positive attitude towards education, knowledge, society, culture, civilization;
- o Curiosity to explore the geographical environment;
- o Respect for the natural and human diversity;
- o Environmental protection and preservation of life.

Cartographic competence interferes with another v competence, of very highest level: understanding of objective reality, as a result of interaction between nature and society and notification that geography is the science dealing with it. The two competences should be complementary (given that there are great possibilities for practicing other skills) (Mândruț et al., 2009).

The general and specific competences monitored in the study are shown in the table 1.

Table 01. The general and specific competence's of the study.

GENERAL COMPETENCES	SPECIFIC COMPETENCES	CONTENTS
1. The integration of aspects from nature and society in an objective structure (environment) and a synthetic discipline (geography).	1.1. Explaining a investigated reality (directly or indirectly) by using scientific language from the domain; 1.2. Explanation of observable relations between science, technology and environment at the local level, by analysis of territorial and functional systems and structures;	Conservation and environment protection

2. Linking elements and phenomena of reality (nature and society) with their mapping and graphic representations on satellite images or models.	2.1. Interpretation of graphic and cartographic representations for presenting a investigated reality; 2.2. Explaining the observable relations between the natural and human environment;	Environmental management
---	---	--------------------------

In our study, we chose the use of some interactive group methods. Specific to interactive group methods is that they promote interaction between participants' minds, of their personalities, leading to a more active learning and obvious results (Chiş, 2002)

In this regard, we chose brainstorming which has as scope that students to interact between them, to generate new ideas and at the same time to assimilate new knowledge (Iucu & Pânişoară, 2000; Neacşu, 2000).

Brainstorming or "delayed assessment" or "brain storm" is an interactive method of developing new ideas arising from discussions between several participants, each of which comes with many suggestions. The outcome of these discussions, results in choosing the best solutions to the discussed situation. As a method of creative discussion, in-group, brainstorming was systematized in 1948 by Alexander Osborn professor from Buffalo University (USA).

The method "assault of ideas" or "waterfall ideas" aims at issuing a large number of solutions, ideas on how to solve a problem in the hope that, by combining them will get the optimal solution. The path for obtaining these ideas is to stimulate creativity within the group, in an atmosphere free of criticism, uninhibited result of postponing the moment of evaluation (Cucoş, 2000).

Brainstorming are conducted in meetings formed from not very large groups (30 people maximum), preferably heterogeneous in terms of training and occupation, under the direction of a moderator, who acts as both an animator and the mediator (Păun, 2002). The optimal duration is 20-45 minutes.

Specific to this method is that it includes two moments: one for the production of ideas and then their evaluation (Phase of critical assessments).

To initiate a brainstorming session, we propose the following steps and phases:

1. Preparation phase which includes: a) the investigation phase and the selection of members of the creative group; b) creative training phase; c) preparation of working sessions;
2. Productive phase, the issuance of creative alternatives, which includes: a) the establishment of the working theme, debated issues; b) phase of solving the formulated problems;
c) Additional ideas gathering phase, necessary for continuing a creative approach;
3. Selection of issued ideas phase that favors critical thinking: a) the analysis phase of the ideas emitted by that time; b) critical assessment phase and choosing the final solution

Students organized in two groups will choose one leader who will represent them in front of the classroom, chosen leader will come on board to write down their outlined ideas.

Step I:

We issue the topic for discussion, coordinate discussions, intervene to correct. Each student presents his ideas, which the group leader notes on an A4 sheet, both groups follow this process.

Step II:

Students receive a series of cartographic representations that have to analyze, to know the icons and to realize what ecotourism activities are represented in the studied material. These maps will help them to identify new ideas about ecotourism and for reading and interpreting tourist maps (see figure 2).

Fig. 2. The eco-touristic map of Bistra village, by student Ludmila Pancec

Cartographic competence interferes with another competence, of very highest level: the understanding of reality objective because of interaction between nature and society and notification that geography is the science that deals with this. The two competences should be complementary skills (Mândruț et al., 2009).

This method allows us to represent in colors the areas of common items (i.e. the area where you can practice various ecotourism activities or you can set goals for practicing various touristic activities) and in addition on the holder of the colorful map may be placed conventional signs and the symbols of different points of interest and activities.

Step III:

After knowing the area under study (Bistra) from the map, according to hypsometric tints, altitudes scale (e.g. vegetation, fauna, and flora) identification of ecotourism activities, familiarity with terms of conservation, protection, ecotourism, and students will receive also photo materials. Will use these to see how it is practiced some ecotourism activities in Bistra village and will receive some plans for sustainable development of the village valuing and protecting the environment.

Step IV:

Students (leader) are asked to submit their ideas on the board for final debate (consolidation of new knowledge).

Were made sheets with student ideas contained in two columns:

A – The ecotourism column made by students achieved in most cases: making trips, nature conservation, practicing cycling activity, observation and protection of habitats ... etc.

B – The sustainable development column made by students in most cases provides community recreation camps, arranging some mixed area of reservations etc.

3. Results and discussions

First, by combining a brainstorming with the application of cartographic methods in a lesson at XI class, I could demonstrate the importance of these methods for teaching and learning geography through the following positive effects: a

- Brainstorming method gave pupils the opportunity to express their ideas freely and argue the stated theme;
- The group work gave students the opportunity to divide opinions, experiences and ideas;
- It minimized the phenomenon of emotional blockage of creativity;
- Cartographic method encouraged students to be more creative and ask questions;
- Through the cartographic method I noticed that students have developed a sense of geographically specific spatial orientation;

Second on that occasion may give some suggestions regarding the use of effective methods for other geography lessons.

- Since a group gives a sense of trust, security and mutually involves the members, we recommend that teacher to bring together students into small groups (3-4 for example instead of 15);
- The collective interaction has the effect "of self-education and a tolerant behavior regarding the point of views of others, overcome subjectivism and accept collective thinking, so teacher to motivate students and to issue critical ideas.
- From experience I can say that it is very useful for the teacher to use brainstorming and photo materials, stimulates discussions, for the next lesson of this type before the discussion, is recommended that students to watch a short movie about the theme.

4. Conclusions

Is very important the positive impact of tourism on the environment, tourism is one of the most important industries and experiences a continuing development. Thus, areas, which have great natural resources, attract more and more visitors especially if they offer the opportunity to know the traditions and customs. When tourism and environment coexist in harmony, the environment benefits from tourism. There are many examples of this kind, most falling into one of two types: environmental conservation and rehabilitation, they often go hand in hand.

The advantages of brainstorming method are multiple. Among them are:

- Quick and easy to obtain new ideas and solutions;
- Reduced costs for use of the method;
- Broad applicability in almost all areas; - Promotes active participation and creates the possibility of contagion of ideas;
- Develop creativity, spontaneity, self-confidence through the delayed assessment process;

- Develop the ability to work in teams;

Limits of brainstorming: do not complement the enduring research, classical; depend of moderator qualities to animate and direct discussion on desired track; only offers possible solutions does not solve the problem; sometimes it can be too tiring for some participants.

Pedagogical competence is a range of qualities, skills, abilities, traits, ensuring efficiency of teaching, not as a dramatic presence of either component, and especially by mainstreaming their resultant. The actual teaching triggers most traits and skills that are a measure of efficiency.
